### Project Vision

This Application will be developed for human resource management stuff.

This could help to solve the management redundant.

This is developed by C#, Windows form App, could easily to Create, Delete, Edit and Show the information of employees in high level of interface.

I have asked my friend who is working at human resource department, said “can you create an app it could easily manage the employees” so, I would choose this type of application.

### Risk Plan

Risk	Risk reduction	Risk Expo-sure
Gold Plating	Done is better than perfect. Think about the task size and duration. Don't spend all time to one function.	5*10
Unrealistic time and cost estimates	Using office planner to visualize the time slot for each task, contact to supervisor each week end, using blog.	3*7
Developing the wrong software functions	Analyse the s/w requirement, evaluate plan,	7*8

	and make sense between storyboard and developing.	
Developing the wrong user interface	same as above, keep checking the requirement and real. And think about how it is going to be used by user.	7*8
Development technically too difficult	Evaluate the difficulty of each function, and if I feel like I do not have enough skill for developing that, just think about the alternative function or just remove from plan then fix the application to fit without that function.	6*9

## Keywords

C#, Windows Form Application, resource management app,
